

2023/24

Sire Catalogue

There's always room for improvement

INTRO

Sally Pocock

Welcome to the LIC UK 2023 sire catalogue. I am Sally Pocock your National Pasture Sales Manager.

This past six months has been a busy time for the LIC team here in the UK with the forming of a exclusive distributorship with Cogent Breeding Ltd. This now allows us to offer farmers a full range of dairy and beef genetics to assist with your herd improvement.

We also welcome two additional team members, Jenny Bailey, who has just started as Farm Solutions Consultant in

Dorset, and starting in September we have a new Farm Solutions Consultant for Scotland.

We have had another successful spring mating period this year as we welcomed in 11 New Zealand technicians to inseminate cows across the UK. It was great to have them back. Along with their level of expertise in block mating, they bring an injection of what has been happening back home in New Zealand.

In the UK we are seeing an uptake in wearable technology on farm, giving farmers more information at their fingertips to assist improving herd performance on farm. The data is providing insights into animal performance, health and fertility. This is also a service we can now provide under our collaboration with the Nedap brand.

Our Herd Improvement Tool is still available free of charge to all our farmers to assess your animal performance on farm and assist with breeding decisions.

This catalogue brings you a variety of daughter proven, sexed and conventional bulls that have come from New Zealand's top breeders, who combine their elite dams and LIC sires.

UNDERSTANDING NEW ZEALAND BULL DATA

Across all Breed Evaluation

The bull data in this catalogue is displayed across all breeds; this is in line with how New Zealand Animal Evaluation Limited (NZAEL) and LIC rank New Zealand dairy animals.

Because many LIC customers here in the UK and around the world select genetics from multiple breeds for optimal herd performance, it is important for farmers to understand how an animal should perform within the whole herd, not just within one breed of the herd.

LIC believe that an across all breed evaluation is the best tool to help you make breeding choices geared toward making your herd the most profitable it can be.

Traits Other than Production

Assessing the Animal

Traits Other than Production (TOP) refer to the behaviour, temperament and physical attributes of a cow and are scored separately on a scale from one to nine. The four farmer-scored and 14 inspector-scored TOP traits are considered most important in relation to the overall requirements of dairy farmers. TOP records from two year-old animals are used for sire evaluations.

Data Processing

The raw data is then sent through to the New Zealand Animal Evaluation unit where within herd, region and national comparisons are analysed and processed. This information is then fed into the national data base as breeding values for sires.

The average raw TOP scores of the 2005 base cow are as follows:

FARMER SCORED MANAGEMENT TRAITS	Low Score	High Score	Base Cow Average
Sire Proving farmers score two-year-old heifers on the four farmer traits			
Adaptability to Milking - describes how soon the heifer settled into the milking routine after calving	slowly	quickly	6.12
Shed Temperament - describes the temperament of the heifer in the farm dairy while being handled and milked	nervous	placid	6.28
Milking Speed - describes the milking speed of the heifer	slow	fast	6.33
Overall Opinion - describes the farmer's overall acceptance of the heifer as a herd member	undesirable	desirable	6.57

INSPECTOR SCORED CONFORMATION TRAITS

Stature - describes the height at the shoulders of the heifer in five centimetre bands	small	tall	5.75
Capacity - describes depth and width of chest and body in relation to the physical size of the heifer	frail	capacious	6.34
Rump Angle - describes the angle of a line between the centre of the hips and the top of the pins	high pins	sloping	4.79
Rump Width - describes the distance between the pins bones, relative to size of the animal	narrow	wide	6.17
Legs - describes the straightness or curvature of the back legs while the heifer is walking	straight	curved	6.18
Udder Support - describes the strength of the suspensory ligament, and the udder depth relative to the hocks	weak	strong	6.02
Front Udder - describes the attachment of the front udder to the body wall	loose	strong	5.70
Rear Udder - describes the height and width of the rear udder attachment	low	high	5.76
Front Teat Placement - describes the placement of the front teats relative to the centre of the quarters	wide	close	4.53
Rear Teat Placement - describes the placement of the rear teats relative to the centre of the quarters	wide	close	5.84
Teat Length - describes the length of the rear teats from the udder to the tip of the teat	short	long	4.10*
Udder Overall - assesses the desirability of all traits pertaining to the udder	undesirable	desirable	5.71
Dairy Conformation - assesses the desirability of all traits pertaining to dairy conformation, but excluding udder traits	undesirable	desirable	6.45

*Teat length was first scored in 2018 so there is no phenotypic average for the Base cow, this average is calculated from raw scores, from daughters of bulls that have a BV of 0

HOW TO READ A SIRE PAGE

Base Cow

Base Cow Production

The New Zealand Base Cow is the genetic reference point from which Breeding Worth (BW) and Breeding Values (BV) are measured for all New Zealand dairy cattle.

All of the bull information in this catalogue is recorded relative to the 2005 Base Cow - the average of 21,585 cows born in the year 2005 - whose production and TOP (traits other than production) data has been set to zero. Each cow has been TOP inspected and milk recorded at least four times to deliver an accurate result.

Base Cow Production

Production is reported on their 270-day lactation yields relative to 5T Dry Matter:

Fat kg	218	Volume (litres)	4595
Protein kg	174	Liveweight (kg)	500

gBW/Rel

Using this bull at a gBW of gBW 367 indicates that per 5T DM eaten, the offspring are expected to generate NZD gBW 367 more net profit than those of a bull of gBW 0. The higher the reliability of gBW, the more data sits behind it and the less likely it is to change with additional data.

Milk

A bull milk gBV of 687 litres indicates that his daughters will on average produce 344 litres more than a bull of gBV 0 litres. The gBV is across breeds, so Jersey and Crossbred animals may show a negative gBV.

Somatic Cell Count

The lower the SCC BV the better, as you want to reduce the bulk milk somatic cell count. A SCC gBV difference of 0.5 between two sires equates to a difference in expected daughter cell count of 37,500 cells/ml.

Fertility

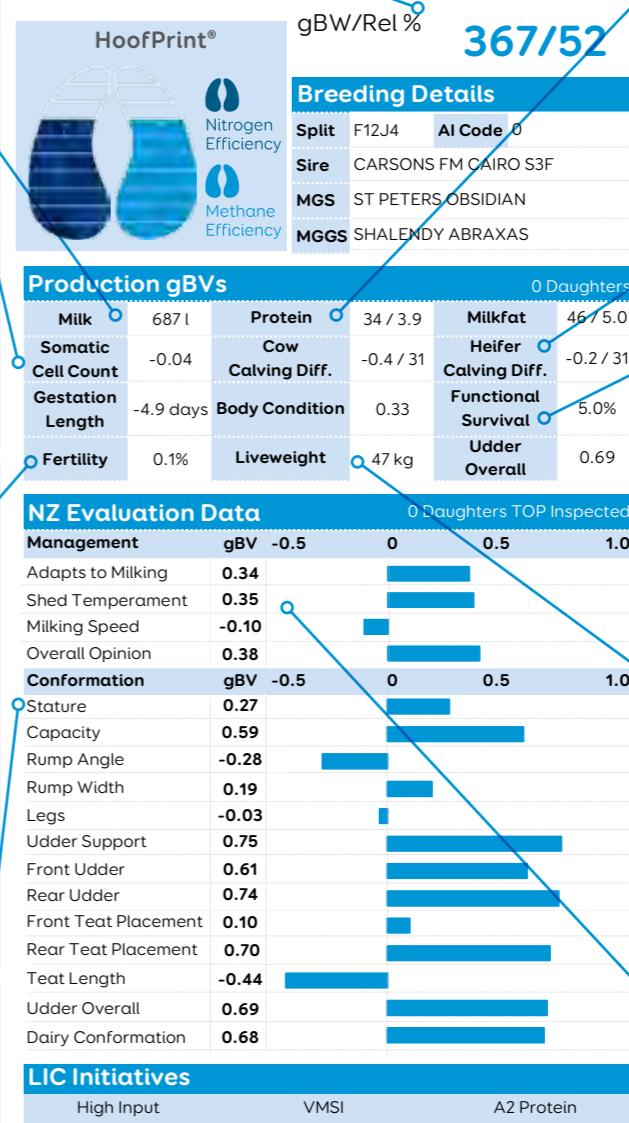

A bull gBV of 0.1% indicates that 0.05% more daughters are expected to calve in the first 42 days of a herds calving period, compared to a bull of gBV 0%. As an industry New Zealand has a tighter calving pattern and shorter calving interval than dairy industries worldwide, with a calving interval of 369 days and average 6-week calving pattern of 83%. Highly fertile cows have been necessary to achieve this. It is generally accepted that the New Zealand genetic base cow is far more fertile than many other countries' genetic base.

Stature

This gBV compares animal stature across breeds based on a genetic reference population with a gBV of 0. Stature for Jerseys is usually negative and for Holsteins is usually positive.

Variable Milking Selection Index

The VMSI has been developed to help farmers breed animals most suited to their system. The index increases based on their suitability for variable milking regimes.

HoofPrint®

Nitrogen and Methane efficiency measure.

Protein

A bull gBV of 34 kg indicates that the bull will produce daughters which on average, are genetically superior by 17 kg per 5T dry matter consumed, compared to a bull of gBV 0kg.

Calving Difficulty

Heifer & Cow CD BVs estimate the expected percentage of assisted calvings when a bull is mated to yearling heifers and cows respectively, compared to a bull of gBV 0. A bull of BV -0.2 can expect to have 0.1% less assisted calvings than a bull of 0.

Functional Survival

A BV that predicts the average probability of survival from one lactation to the next, compared to a gBV 0. It is reported as a percentage. The progeny of a bull of gBV 5.0 should have 2.5% more daughters survive to the next lactation than a bull of BV 0. The average number of lactations/cow in New Zealand is 5.5.

Liveweight

A gBV of 47 kg indicates the sire's daughters are expected to have a mature liveweight 23.5 kg heavier than those of a bull of gBV 0kg. As expected in an across-breed evaluation, Holstein Friesians have a higher (positive) gBV and Jerseys a lower (negative) gBV.

Shed Temperament

A gBV greater than 0.00 indicates that the bull will produce daughters with a more placid temperament than a bull with a gBV of 0.00. (For example, by using a bull with a shed temperament of 0.35 the raw score for his daughters on average is expected to be $6.28 + 0.18 = 6.46$ from a linear score of 9).

 gBW/gBV are calculated by LIC.

BW UPDATE - NZAEL ENHANCEMENTS LAUNCHED IN MARCH 2023

JOYCE VOOGT, TECHNICAL MANAGER, LIC

Joyce Voogt

March 2023 saw the introduction of enhancements to Breeding Worth (BW) by New Zealand Animal Evaluation Ltd (NZAEL). The latest changes involved Fertility and Gestation Length (GL), separating out GL from Fertility breeding value (BV) estimations to provide a more accurate estimation of 'true genetic fertility', as explained below. GL is reported separately, having been added as the 10th trait in BW, with its own breeding and economic values (EV), allowing improved decision making around these traits on farm.

LIC has likewise incorporated the changes into its animal evaluation model which reports slightly different figures due to its inclusion of genomic information.

Why the change?

Fertility BV estimations utilise calving date information, 'Calving Season Day' (CSD), to estimate genetic fertility, and so can be influenced by the gestation length of the calf as well as by the date of conception.

Some additional natural spread is seen, with 95% of calves being born

within ± 9 days of expected calving date. Because gestation length is strongly heritable it impacts the CSD figure, creating a Fertility BV advantage for shorter GL bulls, unless adjusted for.

For this reason, Gestation Length has been separated from Fertility as an interim solution in both the NZAEL and LIC models while NZAEL works towards a conception-based fertility measure in December 2023 as a permanent solution.

The change increases the accuracy of Fertility BV estimations and avoids unintentional selection toward shorter GL. It has resulted in changes in individual bull Fertility BVs in-line with their Gestation Length BVs. Bulls with shorter GL BVs saw a decrease in Fertility BV, while those with longer GL BVs saw an increase.

The changes saw an average decrease of 1.5 fertility genomic BV (gBV) units across 2,158 LIC bulls born between 2010 and 2021. Bulls with more extreme GL BVs saw greater movement. On average, the NZ dairy cow fertility gBV dropped slightly, as the average NZ cow GL is shorter than 282 days.

Gestation length itself is important and of value to farmers, so is added as the 10th trait in Breeding Worth.

The GL EV recognises the economic benefit of shorter gestation length through more days in milk. The economic contribution of GL in BW is capped at -5 days GL BV to moderate selection for GL in BW. The combined effective emphasis in BW for Fertility and GL remains at 15%, most of which is attributable to Fertility.

Breeding values should be considered in the context of the population. The NZ dairy cow population is highly fertile with the average calving interval steady at approximately 369 days over the last 20 years. Fertility BV ranking is relative to that population. Genetic trends for fertility remain positive across the breeds.

Farmers can expect to see the same calving date phenotype on farm, but trait information is now better apportioned to Fertility and GL in both NZAEL and LIC genetic evaluation models.

Phenotypic calving date differences for daughters of bulls with different Fertility BV may be hard to detect on farm, as GL BV and natural variation impact the calf's birth date and non-genetic factors exert a significant influence on conception date.

Average calving interval by days, all recorded cows.
Source: ICAR statistics (2020/21)

SHORT GESTATION LENGTH DAIRY TEAM

With a team of bulls selectively bred to shorten gestation length, the SGL product can help you to shorten your calving, increase days in milk, and give your cows longer to recover improving their chances of getting back in calf.

There is a range of SGL products available:

SGL Dairy

SGL Dairy is a team of bulls with a gestation length up to -20 days. When mated to a cow with normal gestation length, these bulls can reward you with a calving interval up to 10 days shorter than normal. The progeny of these SGL Dairy bulls cannot be kept as replacements.

SGL plus BW

SGL plus BW combines genetics for a shorter gestation with sound genetic merit so farmers can keep heifer calves as replacements. These SGL sires have been tested to ensure their traits are passed on to their offspring, with the purpose of improving the overall efficiency of your herd.

SGL plus BW Team

BEEF OPTIONS

Short Gestation Length (SGL) Hereford

Supplied exclusively from the South Island, New Zealand stud Shrimpton's Hill Herefords are the trait leaders for short gestation length across Australasia.

With over 50 years of breeding behind it, Shrimpton's Hill Hereford stud has dedicated the last 20 years to breeding the dairy farmer must have - short gestation length and calving ease.

The bonus of utilising SGL Hereford as opposed to the average Hereford bull is additional days in milk while still delivering a well marked, saleable beef calf.

SGL Angus Beef

LIC have for many years been working with Rissington Cattle Company for the supply of Angus semen, which is selected for known traits that can make a real difference in cow herd profitability. The Angus herd has been in the Rissington family since 1936.

All animals are recorded on Breedplan and Leachman multibreed database of over one million animals.

Rissington herd was the first Angus herd in New Zealand to be fully genotyped, enhancing the accuracy of information. A number of the Rissington Cattle Company Angus sires have performed at the top of the Beef+Lamb NZ Progeny test scheme against the best Angus bulls from USA, Australia and New Zealand.

The future of dairy is just a consultation away.

There has probably never been a more pressing time for UK farmers to lower production costs and increase efficiency. Forage-based dairy farming could provide a more profitable future. LIC's Pasture to Profit Consultants can walk with you every step of the way. Whether this is to set goals for greater profitability, or to implement new production systems, we'll work alongside you to develop better herd, nutrient and environmental plans.

Secure your future by consulting us today.

OTHER PRODUCTS

LIC Heat Patch Plus

Available in red, pink & blue.

LIC Heat Patch Plus is a self-adhesive heat detection aid, saving time and energy with messy glue. When activated by pressure, the dye can bleed right to the edges of the patch for greater visibility. There is also built in three second time technology, which helps to identify a true standing heat.

Donaghys Tail Alert

1 litre bottle

Donaghys tail paint is highly visible and comes in blue, green, red, yellow, pink and orange. Featuring a brush cap for easy application and the oil-based paint formula lasts up to 30 days in suitable conditions.

LIC Scratch Patch

Pack of 50

LIC Scratch Patch is a cost-effective heat detection aid. It is self-adhesive, so there is no need for glue, and comes in a range of bright colours - red, pink, yellow, blue & green. The friction base technology can prevent false positive readings.

Pasture Plate Meters

Effective feed budgeting is the key to meeting the needs of grazing livestock whilst optimising pasture use efficiency and maintaining pasture quality. LIC UK offers a range of pasture management and feed budgeting tools by Jenquip to help monitor pasture growth, calculate pasture dry matter and create an effective feed budget.

Daisy Paint + Brush

750ml bottle

A wide strip of tail paint can be applied in a single stroke with the patent-pending Daisy Brush. This brush has been designed specifically for use in tail painting and is both curved to match the tail bone and wide enough to lay down a 5cm (2in) strip of tail paint in a single stroke.
